

MASTER FORENSIC SUMMARY REPORT

Purpose of This Report

This report provides a clear overall summary of the digital forensic examinations performed on:

- Four employee Google accounts
- Four mobile devices

This version highlights where **company policies were broken, data handling was improper, or unsafe practices were identified.**

1. Overview of All Examinations

Forensic analysis was completed on:

1. **Google Accounts (Takeout Data)**
 - saish.roham@fanory.com
 - azim@fanory.com
 - manish@fanory.com
 - saurabh@fanory.com
2. **Mobile Devices (4 units)**
 - Google Pixel 6A
 - Samsung Galaxy F14
 - iPhone 13
 - iPhone 14 Pro

2. Key Findings

A) Google Accounts

1. Forwarding Official Company Documents to Personal Gmail

In multiple accounts, official files and emails were sent from the company domain to personal Gmail accounts.

This **violates standard IT security and data-handling policies**, as work files must remain within approved company systems.

2. External Sharing of Company Files

Google Drive review showed:

- Spreadsheets
- Presentations
- Pitch decks
- Project files

being shared with **external/out-of-domain email addresses**.

This is a **major policy breach**, as confidential project files were accessible to non-company users.

3. Storing Personal Photos Mixed With Work Screenshots

In multiple accounts:

- Personal images
- Bank statements
- UI screenshots
- Internal logs
- Project screenshots

were stored together.

This breaks **data privacy**, **information classification**, and **separation of personal and official data** policies.

4. Use of Multiple Unsanctioned Devices

Account activity logs show:

- Several personal mobile phones
- Laptops
- External devices

accessing company data.

This violates **device authorization policies** and increases the risk of data leakage.

5. No Control on Calendar/Activity Tracking

Calendar entries lacked proper work documentation.

Important work activities may not have been recorded, indicating **poor compliance** with documentation requirements.

3. Mobile Devices

All four devices contained **almost no user data**, and appeared to be used only for app testing.

However, **policy issues** include:

Devices Were Cleared / Wiped Before Handover

The phones had:

- No communication data
- No browsing history
- Almost no media
- Minimal folder structure

This strongly suggests the devices were **wiped or reset**, which **breaks evidence preservation and company handover policy**.

4. Combined Summary

Policy Violations Identified

1. **External file sharing** of internal documents.
2. **Forwarding official data** to personal Gmail accounts.
3. **Mixing personal and work data** in Google Photos/Drive.
4. **Access from unauthorized devices**.
5. **Mobile phones wiped before handover** (improper data preservation).
6. **Missing activity logs, test records, and documentation**.
7. **Work files stored in non-secure locations**.
